

# Package ‘geostats’

December 23, 2020

**Title** An Introduction to Statistics for Geoscientists

**Version** 1.0

**Date** 2020-11-14

**Description**

Provides example datasets and code for the introductory statistics module for geoscientists at University College London (UCL). Includes functionality for compositional data, fractals and chaos.

**Author** Pieter Vermeesch [aut, cre]

**Maintainer** Pieter Vermeesch <p.vermeesch@ucl.ac.uk>

**Depends** R (>= 3.5.0)

**Imports** MASS

**License** GPL-3

**LazyData** true

**RoxygenNote** 7.1.1

**Encoding** UTF-8

ACNK	<i>A-CN-K compositions</i>
------	----------------------------

---

**Description**

Synthetic A (Al<sub>2</sub>O<sub>3</sub>), CN (CaO+Na<sub>2</sub>O), K (K<sub>2</sub>O) data table

**Examples**

```
data(ACNK,package='geostats')
ternary(ACNK,type='p',labels=c(expression('Al'[2]*'O'[3]),
                                           expression('CaO+Na'[2]*'O'),
                                           expression('K'[2]*'O')))
```

---

AFM	<i>A-F-M data</i>
-----	-------------------

---

**Description**

(Na<sub>2</sub>O + K<sub>2</sub>O) - FeO - MgO compositions of 630 calc-alkali basalts from the Cascade Mountains and 474 tholeiitic basalts from Iceland.

**Examples**

```
data(AFM,package='geostats')
ternary(AFM[, -1])
```

---

alr	<i>additive logratio transformation</i>
-----	---

---

**Description**

maps compositional data from an n-dimensional simplex to an (n-1)-dimensional Euclidean space with Aitchison's additive logratio transformation

**Usage**

```
alr(dat, inverse = FALSE)
```

**Arguments**

dat	an n x m matrix
inverse	if TRUE, applies the inverse alr transformation

Value

if inverse=FALSE, returns an (n-1) x m matrix of logratios; otherwise returns an (n+1) x m matrix of compositional data whose columns add up to 1.

Examples

```
xyz <- rbind(c(0.03,99.88,0.09),
             c(70.54,25.95,3.51),
             c(72.14,26.54,1.32))
colnames(xyz) <- c('a','b','c')
rownames(xyz) <- 1:3
pc <- prcomp(alr(xyz))
biplot(pc)
```

---

boxcount	<i>box counting</i>
----------	---------------------

---

Description

count the number of boxes needed to cover all the 1s in a matrix of 0s and 1s.

Usage

```
boxcount(mat, size)
```

Arguments

- mat                    a square square matrix of 0s and 1s. Must be a power of 2.
- size                   the size (pixels per side) of the boxes. Should be a power of 2.

Examples

```
g <- sierpinski(n=5)
boxcount(mat=g,size=16)
```

---

Britain	<i>British coast</i>
---------	----------------------

---

Description

a 512 x 512 pixel image of the British coast line

Examples

```
data(Britain,package='geostats')
p <- par(mfrow=c(1,2))
image(Britain)
fractaldim(Britain)
```

---

cantor	<i>Cantor set</i>
--------	-------------------

---

## Description

Calculates or plots a Cantor set of fractal lines.

## Usage

```
cantor(n = 5, plot = FALSE, add = FALSE, Y = 0, lty = 1, col = "black", ...)
```

## Arguments

n	an integer value controlling the number of recursive levels.
plot	logical. If TRUE, the Cantor set is plotted, otherwise a list of breaks and counts is returned.
add	logical (only used if plot=TRUE). If add=FALSE, then a brand new figure is created; otherwise the Cantor set is added to an existing plot.
Y	y-value for the plot (only used if plot=TRUE).
lty	line type (see <code>par.s()</code> for details)
col	colour of the Cantor lines.
...	optional arguments to be passed on to <code>matplot</code> or <code>matlines</code> .

## Details

The Cantor set is generated using a recursive algorithm that is built on a line segment whose middle third is removed. Each level of recursion replaces each black line by the same pattern.

## Value

a square matrix with 0s and 1s.

## Examples

```
g <- sierpinski(n=5)
image(g,col=c('white','black'),axes=FALSE,asp=1)
```

---

circle.plot	<i>plot circular data</i>
-------------	---------------------------

---

**Description**

Plots directional data as ticks on a circle

**Usage**

```
circle.plot(a, degrees = FALSE, tl = 0.1, ...)
```

**Arguments**

a	angle(s), scalar or vector
degrees	TRUE for degrees, FALSE for radians
tl	tick length (value between 0 and 1)
...	optional arguments to be passed on to the generic matlines function

**Details**

Produces a circle with angles plotting in a clockwise direction from the top

**Examples**

```
data(striations, package='geostats')
circle.plot(striations, degrees=TRUE)
```

---

circle.points	<i>add points to a circular plot</i>
---------------	--------------------------------------

---

**Description**

adds directional data as points on an existing circle plot

**Usage**

```
circle.points(a, degrees = FALSE, ...)
```

**Arguments**

a	angle(s), scalar or vector
degrees	TRUE for degrees, FALSE for radians
...	optional arguments to be passed on to the generic points function

**Details**

adds points to a circle with angles plotting in a clockwise direction from the top

**Examples**

```
data(striations,package='geostats')
circle.plot(striations,degrees=TRUE)
md <- meanangle(striations,degrees=TRUE)
circle.points(md,pch=22,bg='black')
```

clasts

*clast size data***Description**

20 clast size measurements, in cm

**Examples**

```
data(clasts,package='geostats')
d <- density(log(clasts))
plot(d)
```

clr

*centred logratio transformation***Description**

maps compositional data from an n-dimensional simplex to an n-dimensional Euclidean space with Aitchison's centred logratio transformation

**Usage**

```
clr(dat, inverse = FALSE)
```

**Arguments**

dat	an n x m matrix
inverse	if TRUE, applies the inverse clr tranformation

**Value**

an n x m matrix

**Examples**

```
xyz <- rbind(c(0.03,99.88,0.09),
             c(70.54,25.95,3.51),
             c(72.14,26.54,1.32))
colnames(xyz) <- c('a','b','c')
rownames(xyz) <- 1:3
pc <- prcomp(clr(xyz))
biplot(pc)
```

---

`colourplot`*colour plot*

---

**Description**

combines a filled contour plot and filled scatter plot for 3-dimensional measurements

**Usage**

```
colourplot(
  x,
  y,
  z,
  X,
  Y,
  Z,
  levels,
  nlevels = 20,
  colspec = rainbow,
  pch = 21,
  cex = 1,
  plot.title,
  plot.axes,
  key.title,
  key.axes,
  asp = NA,
  xaxs = "i",
  yaxs = "i",
  las = 1,
  axes = TRUE,
  frame.plot = axes,
  extra,
  ...
)
```

**Arguments**

<code>x</code>	numerical vector of $n$ equally spaced values
<code>y</code>	numerical vector of $m$ equally spaced values
<code>z</code>	an $n \times m$ matrix of numerical values
<code>X</code>	numerical vector of $N$ values
<code>Y</code>	numerical vector of $N$ values
<code>Z</code>	numerical vector of $N$ values
<code>levels</code>	a set of levels which are used to partition the range of $z$ . Must be <i>strictly</i> increasing (and finite). Areas with $z$ values between consecutive levels are painted with the same colour.
<code>nlevels</code>	if <code>levels</code> is not specified, the range of $z$ , values is divided into approximately this many levels.
<code>colspec</code>	colour specification (e.g., <code>rainbow</code> , <code>hsv</code> , <code>hcl</code> , <code>rgb</code> )
<code>pch</code>	plot character (21 - 25)
<code>cex</code>	plot character magnification
<code>plot.title</code>	statements that add titles to the main plot.
<code>plot.axes</code>	statements that draw axes on the main plot. This overrides the default axes.
<code>key.title</code>	statements that add titles for the plot key.
<code>key.axes</code>	statements that draw axes on the plot key. This overrides the default axis.
<code>asp</code>	the $y/x$ aspect ratio, see <a href="#">plot.window</a> .
<code>xaxs</code>	the $x$ axis style. The default is to use internal labeling.
<code>yaxs</code>	the $y$ axis style. The default is to use internal labeling.
<code>las</code>	the style of labeling to be used. The default is to use horizontal labeling.
<code>axes</code>	logicals indicating if axes should be drawn
<code>frame.plot</code>	logicals indicating if a box should be drawn, as in <a href="#">plot.default</a> .
<code>extra</code>	(optional) extra intructions to be carried out in the main plot window, such as text annotations.
<code>...</code>	additional graphical parameters

**Details**

adds a colour bar to a scatter plot and/or filled contour plot. This function, which is based on base R's `filled.contour` function, is useful for visualising kriging results.

**Examples**

```
data('meuse', package='geostats')
colourplot(X=meuse$x, Y=meuse$y, Z=log(meuse$zinc))
```

---

Corsica	<i>rivers on Corsica</i>
---------	--------------------------

---

**Description**

a 512 x 512 pixel image of the river network on Corsica

**Examples**

```
data(Corsica,package='geostats')
p <- par(mfrow=c(1,2))
image(Corsica)
fractaldim(Corsica)
```

---

countQuakes	<i>count the number of earthquakes per year</i>
-------------	---

---

**Description**

counts the number of earthquakes per year that fall between two magnitude limits

**Usage**

```
countQuakes(qdat, minmag, from, to)
```

**Arguments**

qdat	a data frame containing columns named mag and year.
minmag	minimum magnitude
from	first year
to	last year

**Examples**

```
data(declustered,package='geostats')
quakesperyear <- countQuakes(declustered,minmag=5.0,from=1917,to=2016)
table(quakesperyear)
```

---

declustered	<i>declustered earthquake data</i>
-------------	------------------------------------

---

**Description**

dataset of 28267 earthquakes between 1769 and 2016, with aftershocks and precursor events removed

**References**

Mueller, C.S., 2019. Earthquake catalogs for the USGS national seismic hazard maps. *Seismological Research Letters*, 90(1), pp.251-261.

**Examples**

```
data(declustered, package='geostats')
quakesperyear <- countQuakes(declustered, minmag=5.0, from=1917, to=2016)
table(quakesperyear)
```

---

DZ	<i>detrital zircon U-Pb data</i>
----	----------------------------------

---

**Description**

detrital zircon U-Pb data of 5 sand samples from China

**Examples**

```
data(DZ, package='geostats')
qqplot(DZ[['Y']], DZ[['5']])
```

---

earthquakes	<i>earthquake data</i>
-------------	------------------------

---

**Description**

dataset of 20000 earthquakes between 2017 and 2000, downloaded from the USGS earthquake database (<https://earthquake.usgs.gov/earthquakes/search/>).

**Examples**

```
data(earthquakes, package='geostats')
gutenberg(earthquakes$mag)
```

---

 ellipse

*ellipse*

---

**Description**

compute the x-y coordinates of an error ellipse

**Usage**

```
ellipse(mean, cov, alpha = 0.05, n = 50)
```

**Arguments**

mean	two-element vector with the centre of the ellipse
cov	the 2 x 2 covariance matrix of x and y
alpha	confidence level of the confidence ellipse
n	the number of points at which the ellipse is evaluated

**Examples**

```
X <- rnorm(100,mean=100,sd=1)
Y <- rnorm(100,mean=100,sd=1)
Z <- rnorm(100,mean=100,sd=5)
dat <- cbind(X/Z,Y/Z)
plot(dat)
ell <- ellipse(mean=colMeans(dat),cov=cov(dat))
polygon(ell)
```

---

 exp

*exponential transformation*

---

**Description**

Map the input from  $[-\infty, +\infty]$  to  $[0, \infty]$  by taking exponents

**Usage**

```
## S3 method for class 'density'
exp(x)
```

**Arguments**

x	an object of class density
---	----------------------------

**Value**

an object of class density

**Examples**

```
data(clasts,package='geostats')
lc <- log(clasts)
ld <- density(lc)
d <- exp(ld)
plot(d)
```

---

fault	<i>fault orientation data</i>
-------	-------------------------------

---

**Description**

Ten paired strike and dip measurements (in degrees), drawn from a von Mises - Fisher distribution with mean vector  $\mu = \{-1, -1, 1\}/\sqrt{3}$  and concentration parameter  $\kappa = 100$ .

**Examples**

```
data(fault,package='geostats')
stereonet(fault,option=2,degrees=TRUE,show.grid=FALSE)
```

---

Finland	<i>Finnish lake data</i>
---------	--------------------------

---

**Description**

Table of 2327 Finnish lakes, extracted from a hydroLAKES database.

**References**

Lehner, B., and Doll, P. (2004), Development and validation of a global database of lakes, reservoirs and wetlands, Journal of Hydrology, 296(1), 1-22, doi: 10.1016/j.jhydrol.2004.03.028.

**Examples**

```
data(Finland,package='geostats')
sf <- sizefrequency(Finland$area)
size <- sf[, 'size']
freq <- sf[, 'frequency']
plot(size,freq,log='xy')
fit <- lm(log(freq) ~ log(size))
lines(exp(predict(fit)))
```

---

forams	<i>foram count data</i>
--------	-------------------------

---

### Description

Planktic foraminifera counts in surface sediments in the Atlantic ocean.

### Examples

```
data(forams,package='geostats')
abundant <- forams[,c('quineloba','pachyderma','incompta',
                     'glutinata','bulloides')]
other <- rowSums(forams[,c('uvula','scitula')])
dat <- cbind(abundant,other)
chisq.test(dat)
```

---

fractaldim	<i>calculate the fractal dimension</i>
------------	--

---

### Description

performs box counting on a matrix of 0s and 1s.

### Usage

```
fractaldim(mat, plot = TRUE, ...)
```

### Arguments

mat	a square matrix of 0s and 1s. Size must be a power of 2.
plot	logical. If TRUE, plots the results on a log-log scale.
...	optional arguments to the generic points function.

### Examples

```
g <- sierpinski(n=5)
fractaldim(g)
```

---

fractures	<i>fractures</i>
-----------	------------------

---

**Description**

a 512 x 512 pixel image of a fracture network

**Examples**

```
data(fractures,package='geostats')
p <- par(mfrow=c(1,2))
image(fractures)
fractaldim(fractures)
```

---

geostats	<i>library(geostats)</i>
----------	--------------------------

---

**Description**

A list of documented functions may be viewed by typing `help(package='geostats')`. Detailed instructions are provided at <https://github.com/pvermees/geostats/>.

**Author(s)**

**Maintainer:** Pieter Vermeesch <p.vermeesch@ucl.ac.uk>

---

gutenberg	<i>create a Gutenberg-Richter plot</i>
-----------	--

---

**Description**

calculate a semi-log plot with earthquake magnitude on the horizontal axis, and the cumulative number of earthquakes exceeding any given magnitude on the vertical axis.

**Usage**

```
gutenberg(m, n = 10, ...)
```

**Arguments**

m	a vector of earthquake magnitudes
n	the number of magnitudes to evaluate
...	optional arguments to the generic points function.

**Value**

the output of `lm` with earthquake magnitude as the independent variable (`mag`) and the logarithm (base 10) of the frequency as the dependent variable (`lfreq`).

**Examples**

```
data(declustered, package='geostats')
gutenberg(declustered$mag)
```

---

koch	<i>Koch snowflake</i>
------	-----------------------

---

**Description**

Calculates or plots a Koch set of fractal lines.

**Usage**

```
koch(n = 4, plot = TRUE, res = 512)
```

**Arguments**

<code>n</code>	an integer value controlling the number of recursive levels.
<code>plot</code>	logical. If TRUE, the Koch flake is plotted.
<code>res</code>	the number of pixels in each side of the output matrix

**Details**

The Koch set is generated using a recursive algorithm that is built on a triangular hat shaped line segment. Each level of recursion replaces each linear segment by the same pattern.

**Value**

a `res` x `res` matrix with 0s and 1s

**Examples**

```
k <- koch(n=5)
d <- fractalDIM(k, plot=FALSE)
print(d)
```

---

kriging	<i>kriging</i>
---------	----------------

---

**Description**

ordinary kriging interpolation of spatial data

**Usage**

```
kriging(x, y, z, xi, yi, svm, grid = FALSE, err = FALSE)
```

**Arguments**

<code>x</code>	numerical vector of training data
<code>y</code>	numerical vector of the same length as <code>x</code>
<code>z</code>	numerical vector of the same length as <code>x</code>
<code>xi</code>	scalar or vector with the x-coordinates of the points at which the z-values are to be evaluated.
<code>yi</code>	scalar or vector with the x-coordinates of the points at which the z-values are to be evaluated.
<code>grid</code>	logical. If TRUE, evaluates the kriging interpolator along a regular grid of values defined by <code>xi</code> and <code>yi</code> .
<code>snr</code>	output of the <a href="#">semivariogram</a> function, a 3-element vector with the sill, nugget and range of the semivariogram fit.
<code>model</code>	type of semivariogram fit. Currently only spherical functions are supported

**Details**

implements a simple version of ordinary kriging that uses all the data in a training set to predict the z-value of some test data, given a spherical variogram.

**Value**

either a vector (if `grid=FALSE`) or a matrix (if `grid=TRUE`) of kriging interpolations. In the latter case, values that are more than 10% out of the data range are given NA values.

**Examples**

```
data(meuse, package='geostats')
x <- meuse$x
y <- meuse$y
z <- log(meuse$cadmium)
snr <- semivariogram(x=x,y=y,z=z)
xi <- seq(from=min(x),to=max(x),length.out=50)
yi <- seq(from=min(y),to=max(y),length.out=50)
zi <- geostats::kriging(x=x,y=y,z=z,snr=snr,xi=xi,yi=yi,grid=TRUE)
contour(xi,yi,zi)
```

---

ksdist	<i>Kolmogorov-Smirnov distance matrix</i>
--------	---

---

**Description**

fills a square matrix with Kolmogorov-Smirnov statistics

**Usage**

```
ksdist(dat)
```

**Arguments**

dat                    a list of numerical data vectors

**Examples**

```
data(DZ,package='geostats')
d <- ksdist(DZ)
plot(cmdscale(d))
```

---

logit	<i>logistic transformation</i>
-------	--------------------------------

---

**Description**

maps numbers from  $[0,1]$  to  $[-\infty, +\infty]$  and back

**Usage**

```
logit(x, ...)
```

## Default S3 method:

```
logit(x, inverse = FALSE, ...)
```

## S3 method for class 'density'

```
logit(x, inverse = TRUE, ...)
```

**Arguments**

x                    a vector of real numbers (strictly positive if inverse=FALSE)

...                  optional arguments to the log function.

inverse             logical. If inverse=FALSE, returns  $\ln \left[ \frac{x}{1-x} \right]$ ; otherwise returns  $\frac{\exp[x]}{\exp[x]+1}$ .

**Value**

a vector with the same length of x

**Examples**

```
data(porosity,package='geostats')
lp <- logit(porosity,inverse=FALSE)
ld <- density(lp)
d <- logit(ld,inverse=TRUE)
plot(d)
```

---

major	<i>composition of Namib dune sand</i>
-------	---------------------------------------

---

**Description**

major element compositions of 16 Namib sand samples

**Examples**

```
data(major,package='geostats')
comp <- clr(major)
pc <- prcomp(comp)
biplot(pc)
```

---

meanangle	<i>mean angle</i>
-----------	-------------------

---

**Description**

computes the vector mean of a collection of circular measurements

**Usage**

```
meanangle(trd, plg = 0, option = 0, degrees = FALSE)
```

**Arguments**

trd	trend angle, in degrees, between 0 and 360 (if degrees=TRUE) or between 0 and $2\pi$ (if degrees=FALSE).
plg	(optional) plunge angle, in degrees, between 0 and 90 (if degrees=TRUE) or between 0 and $2\pi$ (if degrees=FALSE).
option	scalar. If codeoption=0, then plg is ignored and the measurements are considered to be circular; if option=1, then trd is the azimuth and plg is the dip; if option=2, then trd is the strike and plg is the dip; if option=3, then trd is the longitude and plg is the latitude; if option=4, then trd is the longitude and plg is the latitude.
degrees	TRUE for degrees, FALSE for radians

Details

averages angles by taking their vector sum

Value

a scalar of 2-element vector with the mean orientation, either in radians (if degrees=FALSE), or in degrees.

Examples

```
data(striations,package='geostats')
meanangle(striations,degrees=TRUE)
```

---

meuse	<i>Meuse river data set</i>
-------	-----------------------------

---

Description

This data set gives locations and topsoil heavy metal concentrations, collected in a flood plain of the river Meuse, near the village of Stein (NL). Heavy metal concentrations are from composite samples of an area of approximately 15 m x 15 m. This version of the meuse dataset is a trimmed down version of the eponymous dataset from the sp dataset.

Examples

```
data(meuse,package='geostats')
semivariogram(x=meuse$x,y=meuse$y,z=log(meuse$cadmium))
```

---

Mode	<i>get the mode of a dataset</i>
------	----------------------------------

---

Description

compute the most frequently occuring value in a sampling distribution.

Usage

```
Mode(x, categorical = FALSE)
```

Arguments

- x                    a vector
- categorical        logical. If TRUE, returns the most frequently occuring value for categorical variables. If FALSE, returns the value corresponding to the maximum kernel density for continuous variables

**Value**

a scalar

**Examples**

```
data(clasts,package='geostats')
m1 <- Mode(clasts,categorical=TRUE)

m2 <- 1:50
for (i in m2){
  m2[i] <- Mode(rnorm(100),categorical=FALSE)
}
hist(m2)
```

---

palaeomag

*palaeomagnetic data*

---

**Description**

Ten paired magnetic declination (azimuth) and inclination (dip) measurements, drawn from a von Mises - Fisher distribution with mean vector  $\mu = \{2, 2, 1\}/3$  and concentration parameter  $\kappa = 200$ .

**Examples**

```
data(palaeomag,package='geostats')
stereonet(palaeomag,degrees=TRUE,show.grid=FALSE)
```

---

PCA2D

*Principal Component Analysis of 2D data*

---

**Description**

produces a 4-panel summary plot for two dimensional PCA for didactical purposes

**Usage**

```
PCA2D(X)
```

**Arguments**

X                      a matrix with two columns

**Examples**

```
X <- rbind(c(-1,7),c(3,2),c(4,3))
colnames(X) <- c('a','b')
PCA2D(X)
```

---

pendulum	<i>3-magnet pendulum experiment</i>
----------	-------------------------------------

---

**Description**

simulate the 3-magnet pendulum experiment

**Usage**

```
pendulum(
  startpos = c(-2, 2),
  startvel = c(0, 0),
  src = rbind(c(0, 0), c(0.5, sqrt(0.75)), c(1, 0)),
  plot = TRUE
)
```

**Arguments**

startpos	2-element vecotor with the initial position
startvel	2-element vector with the initial velocity
src	n x 2 matrix with the positions of the magnets
plot	logical. If TRUE, generates a plot with the trajectory of the pendulum.

**Details**

start a pendulumn at a specified position and with a start velocity.

**Value**

the end position of the pendulum

**Examples**

```
par(mfrow=c(1,2))
pendulum(startpos=c(2,2))
pendulum(startpos=c(1.9,2))
```

---

pH	<i>pH data</i>
----	----------------

---

**Description**

pH measurements in 20 samples of rain water

**Examples**

```
data(pH,package='geostats')
hist(pH)
```

---

porosity	<i>porosity data</i>
----------	----------------------

---

**Description**

20 porosity measurements, as fractions

**Examples**

```
data(porosity, package='geostats')
plot(density(logit(porosity)))
```

---

randy	<i>generate bivariate random data</i>
-------	---------------------------------------

---

**Description**

returns bivariate datasets from four synthetic distributions that have the shape of a circle, arrow, square and ellipse.

**Usage**

```
randy(pop = 1, n = 250)
```

**Arguments**

pop	an integer from 1 to 4 marking the population of choice: 1 = circle, 2 = arrow, 3 = solid square, 4 = ellipse.
n	the number of random draws to be drawn from population pop

**Value**

a [2xn] matrix of random numbers

**Examples**

```
p <- par(mfrow=c(1,4))
for (i in 1:4){
  plot(randy(pop=i))
}
par(p)
```

---

Rbar	<i>calculate <math>\bar{R}</math></i>
------	---------------------------------------

---

### Description

returns  $\bar{R}$ , a measure of directional concentration

### Usage

```
Rbar(trd, plg = 0, option = 0, degrees = FALSE)
```

### Arguments

trd	trend angle, in degrees, between 0 and 360 (if degrees=TRUE) or between 0 and $2\pi$ (if degrees=FALSE).
plg	(optional) plunge angle, in degrees, between 0 and 90 (if degrees=TRUE) or between 0 and $2\pi$ (if degrees=FALSE).
option	scalar. If codeoption=0, then plg is ignored and the measurements are considered to be circular; if option=1, then trd is the azimuth and plg is the dip; if option=2, then trd is the strike and plg is the dip; if option=3, then trd is the longitude and plg is the latitude; if option=4, then trd is the longitude and plg is the latitude.
degrees	TRUE for degrees, FALSE for radians

### Details

Given  $n$  circular or spherical measurements, their length of the normalised vector sum takes serves as a measure of concentration.

### Value

a value between 0 and 1

### Examples

```
data(striations,package='geostats')
Rbar(striations,degrees=TRUE)
```

---

Rbar2kappa	$\bar{R}$ to $\kappa$ conversion
------------	----------------------------------

---

**Description**

converts concentration parameter  $\bar{R}$  to  $\kappa$

**Usage**

```
Rbar2kappa(R, p = 1)
```

**Arguments**

R	a scalar or vector of values between 0 and 1
p	the number of parameters

**Details**

$\bar{R}$  and  $\kappa$  are two types of concentration parameter that are commonly used in directional data analysis.  $\kappa$  is one of the parameters of the parametric von Mises distribution, which is difficult to estimate from the data.  $\bar{R}$  is easier to calculate from data. Rbar2kappa converts  $\bar{R}$  to  $\kappa$  using the following approximate empirical formula:

$$\kappa = \frac{\bar{R}(p+1-\bar{R}^2)}{1-\bar{R}^2}$$

where  $p$  marks the number of parameters in the data space (1 for circle, 2 for a sphere).

**Value**

value(s) between 0 and  $+\infty$

**Examples**

```
data(striations,package='geostats')
Rbar2kappa(Rbar(striations,degrees=TRUE))
```

---

rbsr	<i>Rb-Sr data</i>
------	-------------------

---

**Description**

synthetic dataset of 8 Rb-Sr analysis that form a 1Ga isochron

**Examples**

```
data(rbsr,package='geostats')
plot(rbsr[, 'RbSr'], rbsr[, 'SrSr'])
fit <- lm(SrSr ~ RbSr, data=rbsr)
abline(fit)
```

---

rwyzx	<i>Spurious correlation</i>
-------	-----------------------------

---

**Description**

Calculate the 'null correlation' of ratios

**Usage**

```
rwyzx(  
  mw,  
  mx,  
  my,  
  mz,  
  sw,  
  sx,  
  sy,  
  sz,  
  rwx = 0,  
  rwy = 0,  
  rwz = 0,  
  rxy = 0,  
  rxz = 0,  
  ryz = 0  
)  
  
ryxy(mx, my, sx, sy, rxy = 0)  
  
rxzyz(mx, my, mz, sx, sy, sz, rxy = 0, rxz = 0, ryz = 0)
```

**Arguments**

mw	the mean of variable w
mx	the mean of variable x
my	the mean of variable y
mz	the mean of variable z
sw	the standard deviation of variable w
sx	the standard deviation of variable x
sy	the standard deviation of variable y
sz	the standard deviation of variable z
rwx	the correlation coefficient between w and x
rwy	the correlation coefficient between w and y
rwz	the correlation coefficient between w and z
rxy	the correlation coefficient between x and y

<code>rxz</code>	the correlation coefficient between x and z
<code>ryz</code>	the correlation coefficient between y and z

**Details**

Implements the spurious correlation formula of Pearson (1897)

**Value**

the null correlation coefficient

**Examples**

```
rxzyz(mx=100,my=100,mz=100,sx=1,sy=1,sz=10)
```

---

<code>semivariogram</code>	<i>semivariogram</i>
----------------------------	----------------------

---

**Description**

computes, plots, and fits the semivariogram of spatial data

**Usage**

```
semivariogram(
  x,
  y,
  z,
  bw = NULL,
  nb = 13,
  plot = TRUE,
  fit = TRUE,
  model = c("spherical", "linear", "exponential", "gaussian"),
  ...
)
```

**Arguments**

<code>x</code>	numerical vector
<code>y</code>	numerical vector of the same length as x
<code>z</code>	numerical vector of the same length as x
<code>bw</code>	(optional) the bin width of the semivariance search algorithm
<code>nb</code>	(optional) the maximum number of bins to evaluate
<code>plot</code>	logical. If FALSE, suppresses the graphical output
<code>fit</code>	logical. If TRUE, returns the sill, nugget and range.
<code>model</code>	the parametric model to fit to the empirical semivariogram (only used if <code>fit=TRUE</code> ).
<code>...</code>	optional arguments to be passed on to the generic <code>plot</code> function

**Details**

Plots the semivariance of spatial data against inter-sample distance, and fits a spherical equation to it.

**Value**

if `fit=TRUE`, returns a vector with the sill, nugget and range. If `fit=FALSE`, returns the estimated semivariances at different distances for the data.

**Examples**

```
data(meuse, package='geostats')
semivariogram(x=meuse$x, y=meuse$y, z=log(meuse$cadmium))
```

---

sierpinski

*Sierpinski carpet*

---

**Description**

returns a matrix of 0s and 1s that form a Sierpinski fractal.

**Usage**

```
sierpinski(n = 5)
```

**Arguments**

`n` an integer value controlling the number of recursive levels.

**Details**

The Sierpinski carpet is two dimensional fractal, which is generated using a recursive algorithm that is built on a grid of eight black squares surrounding a white square. Each level of recursion replaces each black square by the same pattern.

**Value**

a square matrix with 0s and 1s.

**Examples**

```
g <- sierpinski(n=5)
image(g, col=c('white', 'black'), axes=FALSE, asp=1)
```

---

sizefrequency	<i>calculate the size-frequency distribution of things</i>
---------------	--

---

**Description**

calculate the number of items exceeding a certain size

**Usage**

```
sizefrequency(dat, n = 10, log = TRUE)
```

**Arguments**

dat	a numerical vector
n	the number of sizes to evaluate
log	logical. If TRUE, uses a log spacing for the sizes at which the frequencies are evaluated

**Value**

a data frame with two columns size and frequency

**Examples**

```
data(Finland,package='geostats')
sf <- sizefrequency(Finland$area)
plot(frequency~size,data=sf,log='xy')
fit <- lm(log(frequency) ~ log(size),data=sf)
lines(x=sf$size,y=exp(predict(fit)))
```

---

skew	<i>calculate the skewness of a dataset</i>
------	--

---

**Description**

compute the third moment of a sampling distribution.

**Usage**

```
skew(x)
```

**Arguments**

x	a vector
---	----------

**Value**

a scalar

**Examples**

```
data(porosity,package='geostats')
skew(porosity)
```

---

stereonet	<i>stereonet</i>
-----------	------------------

---

**Description**

Plots directional data on a Schmidt equal area or Wulff equal angle stereonet.

**Usage**

```
stereonet(
  trd,
  plg,
  coneAngle = 0,
  option = 1,
  wulff = TRUE,
  add = FALSE,
  degrees = FALSE,
  show.grid = TRUE,
  grid.col = "grey50",
  tl = 0.05,
  type = "p",
  labels = 1:length(trd),
  ...
)
```

**Arguments**

trd	trend angle, in degrees, between 0 and 360 (if degrees=TRUE) or between 0 and $2\pi$ (if degrees=FALSE).
plg	plunge angle, in degrees, between 0 and 90 (if degrees=TRUE) or between 0 and $2\pi$ (if degrees=FALSE).
coneAngle	if option=4, controls the radius of a small circle around the pole with azimuth trd and dip plg.
option	scalar. If option=1, then trd is the azimuth and plg is the dip; if option=2, then trd is the strike and plg is the dip; if option=3, then trd is the longitude and plg is the latitude; if option=4, then trd is the longitude and plg is the latitude
wulff	logical. If FALSE, produces a Schmidt net.

<code>add</code>	logical. If TRUE, adds to an existing stereonet.
<code>degrees</code>	logical. If FALSE, assumes that azimuth and dip are in radians.
<code>show.grid</code>	logical. If TRUE, decorates the plot with a grid of great and small circles.
<code>grid.col</code>	colour of the grid.
<code>tl</code>	tick length for the N, E, S, W markers (value between 0 and 1). Set to 0 to omit the markers.
<code>type</code>	if option=1 or 3, coordinates can be visualised as points ( <code>type='p'</code> ), lines ( <code>type='l'</code> ) or decorated with text labels ( <code>type='t'</code> ).
<code>labels</code>	if option=1 or 3 and <code>type='t'</code> , specifies the text labels to be used to mark the measurements on the stereonet.
<code>...</code>	optional arguments to be passed on to the generic <code>points</code> function

### Details

The Wulff equal angle polar Lambert projection preserves the shape of objects and is often used to visualise structural data. The Schmidt equal area polar Lambert projection preserves the size of objects and is more popular in mineralogy.

### Author(s)

based on the Matlab script by Gerry Middleton

### Examples

```
stereonet(azimuth=c(120,80),dip=c(10,30),degrees=TRUE)
```

---

<code>striations</code>	<i>directions of glacial striations</i>
-------------------------	---

---

### Description

directions (in degrees) of 30 glacial striation measurements from Madagascar.

### Examples

```
data(striations,package='geostats')
circle.plot(striations,degrees=TRUE)
```

---

ternary	<i>ternary diagrams</i>
---------	-------------------------

---

**Description**

plot points, lines or text on a ternary diagram

**Usage**

```
ternary(xyz = NULL, f = rep(1, 3), labels, add = FALSE, type = "p", ...)
```

**Arguments**

- xyz                    an n x 3 matrix or data frame
- f                     a three-element vector of multipliers for xyz
- labels                the text labels for the corners of the ternary diagram
- add                   if TRUE, adds information to an existing ternary diagram
- type                  one of 'n' (empty plot), 'p' (points), 'l' (lines) or 't' (text).
- ...                   optional arguments to the points, lines or text functions.

**Examples**

```
data(ACNK,package='geostats')
ternary(ACNK,type='p',labels=c(expression('Al'[2]*'O'[3]),
                                     expression('CaO+Na'[2]*'O'),
                                     expression('K'[2]*'O')))
```

---

test	<i>composition of oceanic basalts</i>
------	---------------------------------------

---

**Description**

major element compositions of 64 island arc basalts (IAB), 23 mid oceanic ridge basalts (MORB) and 60 ocean island basalts (OIB). This dataset can be used to test supervised learning algorithms.

**Examples**

```
library(MASS)
data(training,package='geostats')
data(test,package='geostats')
qd <- qda(affinity ~ ., data=training)
pr <- predict(qd,newdata=test[,,-1])
table(test$affinity,pr$class)
```

---

training	<i>composition of oceanic basalts</i>
----------	---------------------------------------

---

**Description**

major element compositions of 227 island arc basalts (IAB), 221 mid oceanic ridge basalts (MORB) and 198 ocean island basalts (OIB). This dataset can be used to train supervised learning algorithms.

**Examples**

```
library(MASS)
data(training,package='geostats')
qd <- qda(affinity ~ ., data=training)
pr <- predict(qd)
table(training$affinity,pr$class)
```

---

---

vonMises	<i>von Mises distribution</i>
----------	-------------------------------

---

**Description**

returns the probability density of a von Mises distribution

**Usage**

```
vonMises(a, mu = 0, kappa = 1, degrees = FALSE)
```

**Arguments**

a	angle(s), scalar or vector
mu	scalar containing the mean direction
kappa	scalar containing the concentration parameter
degrees	TRUE for degrees, FALSE for radians

**Details**

the von Mises distribution describes probability distributions on a circle using the following density function:

$$\frac{\exp(\kappa \cos(x-\mu))}{2\pi I_0(\kappa)}$$

where  $I_0(\kappa)$  is a zero order Bessel function

**Value**

a scalar or vector of the same length as angles

Examples

```
plot(x=c(-1.2,1.2),y=c(-1.2,1.2),type='n',
      axes=FALSE,ann=FALSE,bty='n',asp=1)
a <- seq(from=-pi,to=pi,length.out=200)
d <- vonMises(a=a,mu=pi/2,kappa=5)
symbols(x=0,y=0,circles=1,add=TRUE,inches=FALSE,xpd=NA,fg='grey50')
lines(x=(1+d)*cos(a),y=(1+d)*sin(a),xpd=NA)
```

---

worldpop	<i>world population</i>
----------	-------------------------

---

Description

The world population from 1750 until 2014

Examples

```
data(worldpop,package='geostats')
plot(worldpop)
```

---

xyz2xy	<i>get x,y plot coordinates of ternary data</i>
--------	---

---

Description

helper function to generate bivariate plot coordinates for ternary data

Usage

```
xyz2xy(xyz)
```

Arguments

xyz                    an n x 3 matrix or data frame

Value

an n x 2 numerical matrix

Examples

```
xyz <- rbind(c(1,0,0),c(0,1,0),c(0,0,1),c(1,0,0))
xy <- xyz2xy(xyz)
plot(xy,type='l',bty='n')
```

york

*Linear regression of X,Y-variables with correlated errors***Description**

Implements the unified regression algorithm of York et al. (2004) which, although based on least squares, yields results that are consistent with maximum likelihood estimates of Titterton and Halliday (1979).

**Usage**

```
york(dat, alpha = 0.05, plot = TRUE, fill = NA, ...)
```

**Arguments**

<b>dat</b>	a 4 or 5-column matrix with the X-values, the analytical uncertainties of the X-values, the Y-values, the analytical uncertainties of the Y-values, and (optionally) the correlation coefficients of the X- and Y-values.
<b>alpha</b>	cutoff value for confidence intervals.
<b>plot</b>	logical. If true, creates a scatter plot of the data with the best fit line shown on it.
<b>fill</b>	the fill colour of the error ellipses. For additional plot options, use the IsoplotR package.
<b>...</b>	optional arguments for the scatter plot.

**Details**

Given  $n$  pairs of (approximately) collinear measurements  $X_i$  and  $Y_i$  (for  $1 \leq i \leq n$ ), their uncertainties  $s[X_i]$  and  $s[Y_i]$ , and their covariances  $\text{cov}[X_i, Y_i]$ , the `york` function finds the best fitting straight line using the least-squares algorithm of York et al. (2004). This algorithm is modified from an earlier method developed by York (1968) to be consistent with the maximum likelihood approach of Titterton and Halliday (1979).

**Value**

A two-element list of vectors containing:

**coef** the intercept and slope of the straight line fit

**cov** the covariance matrix of the coefficients

**References**

Titterton, D.M. and Halliday, A.N., 1979. On the fitting of parallel isochrons and the method of maximum likelihood. *Chemical Geology*, 26(3), pp.183-195.

York, Derek, et al., 2004. Unified equations for the slope, intercept, and standard errors of the best straight line. *American Journal of Physics* 72.3, pp.367-375.

**Examples**

```
X <- c(1.550,12.395,20.445,20.435,20.610,24.900,  
      28.530,50.540,51.595,86.51,106.40,157.35)  
Y <- c(.7268,.7849,.8200,.8156,.8160,.8322,  
      .8642,.9584,.9617,1.135,1.230,1.490)  
n <- length(X)  
sX <- X*0.01  
sY <- Y*0.005  
rXY <- rep(0.8,n)  
dat <- cbind(X,sX,Y,sY,rXY)  
fit <- york(dat)
```
